#================================
# Sentiment Classification using BERT
# ================================

#Installdependencies:
# pip install transformers torch

from transformers import pipeline

# Step 1: Load pre-trained sentiment analysis model
classifier = pipeline(
    "sentiment-analysis",
    model="distilbert-base-uncased-finetuned-sst-2-english"
)

# Step 2: Input sentences
sentences = [
    "I love using natural language processing!",
    "This is the worst movie I have ever watched.",
    "The food was okay, nothing special."
]

# Step 3: Perform sentiment classification
results = classifier(sentences)

#Step4:Printresults
for sentence, result in zip(sentences, results):
    print(f"Sentence: {sentence}")
    print(f"Label: {result['label']}, Confidence: {result['score']:.4f}")
    print()
```

Output

```
Sentence:Iloveusingnaturallanguageprocessing! Label:
POSITIVE, Confidence: 0.9991

Sentence:ThisistheworstmovieIhaveeverwatched. Label:
NEGATIVE, Confidence: 0.9987

Sentence:Thefoodwasokay,nothingspecial.
Label: POSITIVE, Confidence: 0.6504
```
